# Impeller Accessories & Installation Guide

1. Remove and separate the whole jet pump from the PWC.
2. Remove the trail cone (or cap) from the stator.
3. Hold the rear end of the shaft with a bench vise. Remove the impeller with an impeller wrench (optional part) Turning counter-clockwise will loosen the impeller.
4. Visually inspect thread on shaft & impeller for debris or damage. Apply grease or anti-seize on the thread before installation.
5. Screw in the impeller by hand; please be careful of the sharp edges of the impeller. Tighten with the impeller wrench. If the impeller feels too tight or not threaded properly, unscrew the impeller, clean and check the thread.
6. Assemble the pump and refill O/E pump oil or grease to spec.

## MerCruiser Aluminum Anode Kits

- Anodes feature patent pending “Wear Indicator” which tell the boater when it’s time to change.
- Aluminum/Indium alloy is more active so it gives better protection.
- Aluminum anodes are essential for Mercury sterndrives. Zinc will not provide the correct protection.
- Aluminum anodes are recommended for both salt and freshwater on Mercury sterndrives.
- Aluminum anodes last up to 50% longer than zinc anodes.
- Aluminum anodes “self-clean” in freshwater. Zinc anodes form a coating that stops them from working within a few months
- Aluminum anodes are environmentally friendly. • Aluminum anodes come with the required hardware for mounting.
- Attractively packaged with clear information to aid with selection and installation - reducing the need for trained store staff.

# GROOMS GENUINE MARINE ENGINES LIMITED WARRANTY

## Warranty Coverage

Your Grooms Genuine Marine engine is warranted against failures caused by defective parts or workmanship for 12 months from the date the remanufactured engine was installed if it is used for personal pleasure or for 90 days if it is used for commercial purposes. It covers the engine and the parts supplied by Grooms and pays labor according to our reimbursement schedule. Repairs or replacements do not extend this warranty.

## Warranty Procedures

If you have a problem with a Genuine Marine engine, call your distributor. They will assign a reference number and help determine what needs to be done. Any parts that may be defective must be returned to the manufacturer for inspection on a designated freight line.

THIS WARRANTY EXCLUDES ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, PROVIDED, HOWEVER, THAT IF AND TO THE EXTENT THAT AN IMPLIED WARRANTY CANNOT BE DISCLAIMED UNDER APPLICABLE LAW, SUCH WARRANTY SHALL BE LIMITED IN DURATION TO THE DURATION OF THE COMPARABLE EXPRESS WARRANTY CONTAINED HEREIN.

- Built to Last...
- We do it right...
  And it's worth it!
- If it's worth doing...
  It's worth doing right!

## Warranty Reimbursement

If the failure of a Grooms Genuine Marine engine is caused by our defective workmanship or materials, we will repair the engine, replace it, or refund the cost of the engine at our option. Labor for the removal and replacement of the engine will be reimbursed at $50/hour up to a maximum of $500 if the engine was installed by a qualified technician. Field repairs must be authorized before the work is done. Parts and labor will be paid after we have received the parts, inspected them, and determined that they were defective. Labor will be reimbursed at $50/hour up to a maximum of $500 for the complete repair.

## Warranty Limitations

This warranty does not cover problems or failures caused by components not supplied by Grooms, abuse, or an improper installation. It is not an unconditional warranty against all hazards or failures. Problems caused by preignition, detonation, lack of lubrications, piston scuffing due to abuse, overheating, dirt and debris, water in the engine from external sources, damage caused by freezing, or modification are specifically excluded from any warranty consideration. Routine maintenance such as valve adjustment is not covered by the warranty. This warranty does not include reimbursement for phone expenses, boat rental, storage or slip fees, loss of use or income, additional labor or any other consequential and/or incidental damages under any circumstances. The gasket sets included with our engines may not include everything needed for a specific application so you may have to purchase additional gaskets at your expense to complete the installation. We are not responsible for problems with any gaskets, including head gaskets, that were not installed by Grooms. No repairs will be covered by this warranty without the specific prior notice and consent of Grooms Engines or its authorized distributor. Notice of a defect must be made prior to the expiration of the warranty. The buyer's right to repairs, replacement or refund, according to this warranty, is the buyer's exclusive remedy. This warranty is not transferrable to anyone else.

Positive intake seals meter the oil to the valve stems to reduce oil consumption and help prevent abnormal combustion.

Melling double roller, heavy-duty timing chain passes GM's 400-hour "clock test." No car-type, link chain has ever passed this test.

Brass freeze plugs will never rust or corrode like the standard steel ones found in most other engines.

Heavy-duty valves with chrome-plated stems that minimize wear insure longer life and better performance.

Southern MARINE

New heads with the right intake ports flow 26% more air than the car heads that are used by most other rebuilders.

Sierra International is pleased to announce over 100 new products focused entirely on servicing the marine generator market. Recognizing the lack of available aftermarket generator service parts, this market segment represents an entirely new product line for Sierra.

Utilizing our famed catalog design and easy to use reference charts, finding the generator part you need when you need it will be easier than ever before. The following pages cover all applicable product categories (Electrical, Fuel, Cooling, Internal Engine, Gaskets, & Corrosion Protection); with a focus on Kohler®, Onan® & Westerbeke® Generator Sets.

Like all Sierra products, quality is insured by our industry leading Limited Lifetime Warranty. This warranty covers you in the unlikely event of a product failure with not only defective product replacement, but the labor and incidental charges reimbursed as well.

Aftermarket generator service parts, another first from Sierra!

Example:

**VZ300TLRD = 2005** **VZ300TLR = New model after April 2005.** **VZ300BTLR = Newest Model and direct replacement for previous models.**

# V-BELTS

1. High strength synthetic cords resist shockload failure. Their low stretch properties assure uniform performance over the life of the belt.
2. The compression section is a special rubber compound that assures smooth and even transfer of load forces to the cords.
3. Cogs are molded to precise engineering tolerances to improve flexibility and maintain cord support. Cog geometry provides a large area for air circulation to keep the belt cool and prevent damaging heat build up in the cushion section.
4. Rubber edges maintain positive, no-slip contact with pulley grooves for reliable energy transfer.

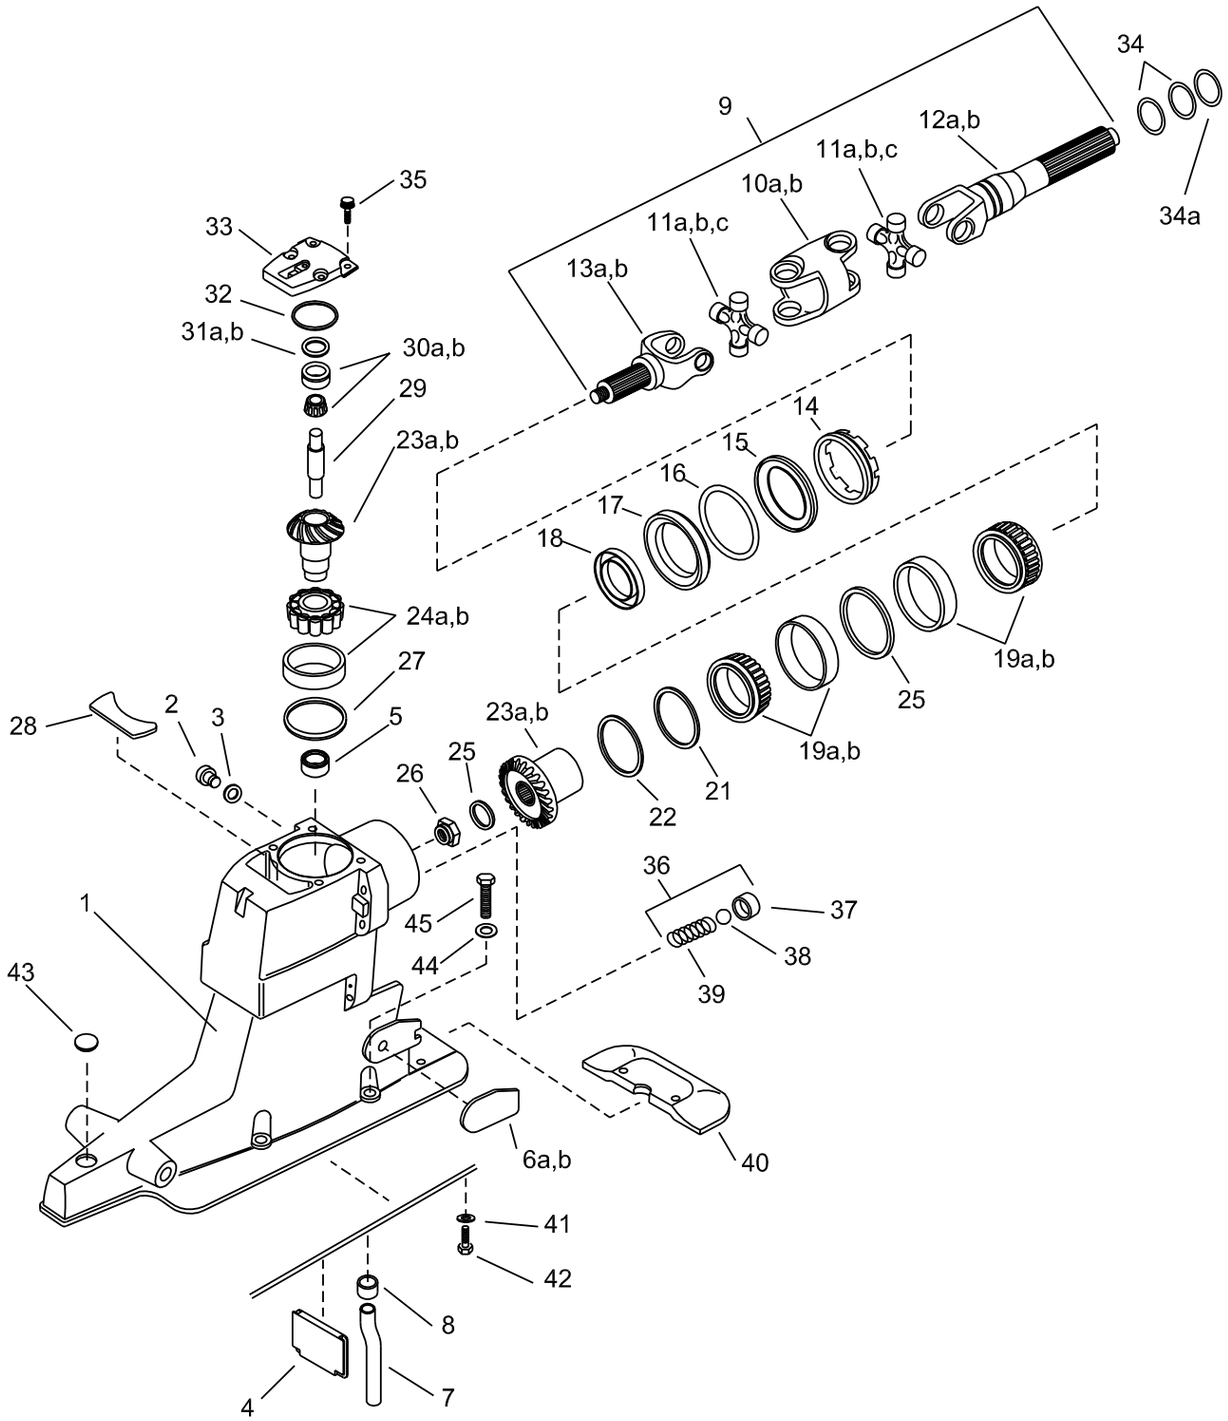
U-Joint Coupling End Yoke (39385A1) used on older in-line models



## Use of Older Model Stern Drive Units On Mercruiser IR-IMR Models

Mercury Marine does not recommend the use of older model stern drive units on IR-IMR models, as these units will not mate up satisfactorily with the transom assembly. In addition, the older model in-line stern drive units are equipped with U-Joint coupling end yoke (39385A1). This yoke is shorter than yoke (59830A1) used on the IR-IMR stern drive units, and therefore, will not fully engage the engine coupler splines. **Use of an older In-Line model stern drive unit on a IR-IMR model will result in a spline failure to coupling and/or yoke.**

## V-BELTS

1. High strength synthetic cords resist shockload failure. Their low stretch properties assure uniform performance over the life of the belt.
2. The compression section is a special rubber compound that assures smooth and even transfer of load forces to the cords.
3. Cogs are molded to precise engineering tolerances to improve flexibility and maintain cord support. Cog geometry provides a large area for air circulation to keep the belt cool and prevent damaging heat build up in the cushion section.
4. Rubber edges maintain positive, no-slip contact with pulley grooves for reliable energy transfer.

## V-BELTS

1. High strength synthetic cords resist shockload failure. Their low stretch properties assure uniform performance over the life of the belt.
2. The compression section is a special rubber compound that assures smooth and even transfer of load forces to the cords.
3. Cogs are molded to precise engineering tolerances to improve flexibility and maintain cord support. Cog geometry provides a large area for air circulation to keep the belt cool and prevent damaging heat build up in the cushion section.
4. Rubber edges maintain positive, no-slip contact with pulley grooves for reliable energy transfer.

## Thermomelt Temp Sticks

Long lasting Temp Stiks provide a quick and reliable means to check cooling systems. With engine warmed up, the temp stik is used like a crayon to make a mark on the head or the block. The mark will appear dull and chalky. On a typical engine, the T125 (125 deg.) should melt, turning liquid and glossy in appearance. If it doesn't, the engine is running too cold. A mark made with the T163 (163 deg.) should not melt. If it does, the engine is running too hot.

519-T175 (Up to 175°)

# TROUBLESHOOTING OMC POWER PACKS AND CD's

Recommended Tools: For DVA: Fluke Multimeter with CDI #511-9773 Peak Adapter, (or CD-77) and CDI #511-9770. Piercing Probes CDI #511-9710. Trigger Tester CDI #511-9766. Spark Gap tester. Jumper Wire. Note: If CD-77 is used for DVA, you will need a good volt/ohm meter.

***1) Check the flywheel for cracked and loose magnets.*** Be sure the magnets are secure.

***2) Disconnect the kill wire(s) from the pack*** and connect a DC voltmeter between the kill wires and engine ground. Turn the ignition switch on and off several times. If, at any time, you see DC voltage appearing on the meter, there is a problem in the harness or Ignition switch. *NOTE: At* no *time should you* see *battery voltage* on *any kill wires.*

***3) Visually inspect stator for cracks or leaks:*** If found, replace the stator. Burnt marks or discolored areas on the battery charge windings indicate a possible problem with the rectifier.

***4) Unit will not fire:*** Disconnect kill wire AT THE PACK. Check for broken or bare wires on the unit, stator and timer base. Measure DVA voltage of the stator with everything connected. Readings should be approximately 150 volts or more. On standard CD types, check DVA voltage on the timer base white wire. Voltage should be approximately 150 volts or more (Quick start units usually have the white wire tied to ground inside the pack). If reading is good on the stator but low on the white wire, the timer base is usually bad. Disconnect the rectifier. If the engine fires, replace the rectifier.

***5) '88-'96 V6 and V8 Quick start timer bases:*** Disconnect the timer base. Using the Fluke meter set to ohms scale, and one of the piercing probes, connect the red lead from the meter to the white wire In the Amphenol connector from the timer base. Use the black lead from the meter and check to all of the pastel colored wires in both connectors from the timer base. All of the readings should be fairly even, normally between 1 and 2 meg ohms measured with the Fluke meter. With the red lead still connected to the white wire, connect the black meter lead to the black/whlte wire in the opposite connector from the timer base. You should read approximately 220 ohms (440 ohms on the GT150/175). If one of more cylinders are out of line, (i.e. all the rest are reading 1.2 - 1.8 meg ohms and one reads 0.898 or 2.2 meg ohms) the timer base is usually bad.

***6) '92-'96 Looper units with optical triggers:*** DVA check the stator, each set of brown wires should read at least 150V (950-1050 ohms) and 12 volts between the two orange wires from the power coil (50 ohms). Note: These units require special spark plugs and the GRAY spark plug wires. If the pack only fires when you remove the plug connector containing the kill wires, use a jumper wire to connect the kill wires in the pack. If the pack still fires, there is a problem in the harness, safety circuit or Ignition switch. A no fire situation with the jumper in place indicates a bad pack.

***7) '89-'95 4 cylinder Looper units;*** If the engine misses on one cylinder with the white/black temperature wire hooked up and does not with it unhooked, it is usually the timer base causing the problem.

***8) For PP4 units: Cylinder 1 & 3 or 2 & 4 will not fire:*** Check timer base resistance between 1-3 and 2-4. Reading should read *8-14*ohm on each. Check air gap on sensor coils. If regaping is needed use CDI R97 -2 Sensor Gap Gauge.

***9) Engine will not kill:*** Remove the black/yellow kill wire from the rubber connector to see if the pin is broken. Check kill circuit in the pack by using a jumper wire connected to the black/yellow wire coming out of the pack and shorting it to ground. If this kills the engine, the kill circuit in the harness or boat is bad, or the ignition switch is bad.

***10) Coils fire with spark plugs out but not In:*** Check for dragging starter or low battery causing slow cranking speed. DVA test stator and timer base.

***11) Engine runs rough on one bank (4 & 6 cylinder engines with CD ignitions):*** DVA check stator voltage to both sides. The readings should be fairly equal. If it exceeds 400 volts, replace the pack on that bank. If unequal, swap banks with stator leads and see if the problem moves with the stator leads. If it does, replace the stator. Disconnect one of the black/yellow kill wires, AT THE PACK. It the problem goes away, replace the pack that was running smooth as it probably has a bad blocking diode.

***12) Intermittent firing on one or more cylinders:*** Low voltage from the stator or a bad timer base. Disconnect rectifier and retest. If the problem disappears, replace the rectifier.

***13) Check for broken wires and terminals:*** Especially check inside the rubber Amphenol plug-in connectors. We recommend that you remove the pins from the connectors and visually inspect them.

# *MERCURY TROUBLESHOOTING*
## *(Alternator Driven Ignition)*

Recommended Tools: For DVA: Fluke Multimeter with CDI #511-9773, Peak Adapter, (or CD-77) and CDI #511-9770, Piercing Probes CDI #511-9710, Trigger Tester CDI #511-9766 Spark Gap Tester, Jumper Wire
Note: If CD-77 is used for DVA, you will need a good volt / ohm meter.

***1) Disconnect the kill wire(s):*** Connect a DC volt meter between the kill wires and engine ground. Turn the Ignition switch on and off several times. If, at any time, you see DC voltage on the kill wires, there is a problem with the harness or ignition switch. Battery voltage on the kill circuit will destroy most CD units.

***2) Visually Inspect stator for cracks or varnish leakage:*** If found, replace the stator. Burned marks or discolored areas on the battery charge windings indicate a possible problem with the rectifier.

***3) Unit will not fire:*** Disconnect kill wire AT THE PACK. Check for broken or bare wires on the unit, stator and trigger. Check the DVA voltage of the stator, (on 3 and 6 cylinder models read from each red and blue wire to engine ground; on 4 cylinder read between the two red wires and between the two blue wires), with everything connected. The readings should be approximately 180 volts or more on the blue wires, and 30 volts or more on the red wires. Disconnect the rectifier. If the engine fires, replace the rectifier.

***4) Engine will not kill:*** Check kill circuit in the pack by using a jumper wire connected to the black/yellow terminal or wire coming out of the pack and shorting it to ground. If this kills the engine, the kill circuit in the harness or on the boat is bad, possibly the Ignition switch.

***5) High speed miss:*** Disconnect the rectifier and retest. If miss is gone, rectifier is usually at fault. If the miss still exists, check DVA voltage (between the red wires on 4 cylinder, or red wires to engine ground on 3 & 6 cylinder) of the stator at high speed. NOTICE: use caution when doing this and do not exceed the rated voltage range of your meter (CD-77= 5OOV, Fluke=1000V). The readings should show a smooth climb in voltage. If there is a sudden or fast drop in voltage right before the miss becomes apparent, the stator is usually at fault. If there is no indication of the problem, it could be a small water leak in one or two cylinders.

***6) Coils fire with spark plugs out but not In:*** Check for dragging starter or low battery causing slow cranking speed. DVA test stator and trigger. Disconnect rectifier, regulator and retest. If the problem goes away, replace the rectifier and/ or regulator.

***7) Engine runs rough on top or bottom two cylinders (4 cylinder engines):*** Check DVA voltage of the stator between blue wires and to ground. Readings to ground should be fairly equal. If unequal, swap stator leads (blue with blue / white, red with red / white) and see it the problem moves with the stator leads. If it does, replace the stator. Check trigger resistance between #1 & #2, compare to resistance between #3 and #4. The readings should be approximately 850 to 1250 ohms for OEM (950 ohms for CDI & Rapair). For test purposes only, swap trigger leads 1 & 3, and 2 & 4. If the problem moves, replace the trigger. If It does not move, swap coil primary wires, and replace the pack if the problem remains on the same terminals.

***8) No fire on one bank (Odd or eyen cylinders on Inline 6 cylinder engines:*** Check DVA Voltage of the stator, checking from each red and blue wire to engine ground. The readings should be approximately 180 volts or more on the blue wires and 30 or more on the red wires. It a DVA meter is not available, swap both sets of the stator wires between the packs. If the problem moves, replace the stator. If the problem stays on the same bank, swap physical location and all connections of the two packs. If the problem stays with one pack, replace the pack. NOTE: If the pack is bad, it is recommended that BOTH packs be replaced if the packs are not manufactured by CDI or Rapair. If the packs lose ground, internally or externally, the packs manufactured by other sources usually have severe damage to the bias circuit and have to be replaced as a set. The packs manufactured by CDI and Rapair will withstand loss of ground connection, normally with no damage to the bias circuitry. In most cases you will just lose fire.

***9) Intermittent firing on one or more cylinders:*** Disconnect the white / black wire between the packs on a 6 cylinder and retest. If all cylinders now fire, replace both packs as there is a problem in the bias circuitry. On all others, check for low voltage from the stator and trigger. Disconnect the rectifier and retest. If the problem disappears, replace the rectifier.

***10) All cylinders fire but the engine will not crank and run:*** On 3 and 6 cylinder engines disconnect the white/black wire and check the bias circuit (white/black terminals) resistance to engine ground. Readings should be approximately 15,000 ohms for standard packs and 9600 ohms for racing units. If the readings are correct on the packs, index the flywheel and check timing on all individual cylinders. If the timing varies, replace the packs. On 4 cylinder engines the bias circuit Is Internal, therefore the only way to verify proper operation of the bias circuit is to Index the flywheel and check timing on each cylinder. If the timing is off replace the packs.
